

Keep the presentation for maximum of 20 minutes (Ensure to utilize the whole 20 minutes, not more than 20 or less than 20 but exactly 20) – This includes the demonstration of your prototype.

Slide 1 – Title Slide

Slide 2 – Agenda Slide (Just show the agenda do not spell them out)

Use the following guidelines to structure the rest of the presentation slides.

1. Tell the Problem very clearly with the support of LR with citation wherever possible.
2. Tell the Research Gap that you have identified. (Can be explained with the concept map) again add citations where applicable – this is the most important part
3. Tell the Project's Aim.
4. Design of the System. => use architecture diagram for prototype and algorithm/flowchart/neural network architectural design if there's an AI/ML model
5. Implementation with the support of technology stack. => use technology stack diagram
6. If there's an AI/ML model, explain clearly the dataset, preprocessing, model training, experiments conducted etc.
7. Demonstration of the Prototype.
8. Testing and evaluation.
 - a. Outline the Evaluations conducted – AI/ML Model and/or Prototype
 - b. Critical Evaluation Outcome
 - c. Highlight the Contribution to the body of knowledge => tell the challenge in achieving them (Problems and Challenges faced)
9. Novelty => clearly explain
10. Limitations and the future Work
11. Conclusion
 - a. New skills acquired
 - b. Use of existing skills

Final Slide – Summary (Summarize the key take aways from the presentation. Your contributions should be clearly stated)
